# I. INTRODUCTION

Quality agriculture statistics are useful in monitoring the performance of national agricultural programs and hence, imperative for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. In this regard, the National Institute of Statistics of Rwanda (NISR) in collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI) conducts the Seasonal Agricultural Survey (SAS) to gather agricultural information mainly related to potential agricultural land use; crop area, crop yield and production; agricultural inputs and practices as well as other agricultural statistics.

This survey is not covering data on coffee and tea production, they are obtained from administrative records collected by the National Agricultural Export Development Board (NAEB). Seasonal Agricultural Survey (SAS) covers three main agricultural seasons: Season A (September to February of the following year), Season B (March to June) while Season C (July-September) is a shorter season mainly for vegetables, sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

## 1.1. Objectives of SAS

The main objective of SAS is to provide timely, accurate, reliable and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda mainly in terms of land use, crop area, yield and crop production. The survey results are useful to monitor the current agricultural and food supply conditions and facilitate evidence-based decision making for the development of the agricultural sector. This report presents the findings of 2023 season A related to:

1. Land use:
  - Agricultural land: It is part of land potential for agriculture which includes land already used for farming, fallow land “farmland ploughed but left for a period without being sown in order to restore its fertility or to avoid surplus production”, and land used as pasture.
  - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area excludes land under permanent crops<sup>1</sup> and permanent pasture.
  - Physical crop cultivated area: area occupied with crops.
  - Pasture land: area under natural grasses reserved for livestock or occupied with fodder crops;
  - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years).
2. Crop land: Cultivated land devoted to each cultivated crop.
3. Crop production: Quantity of harvested crop produce used for food, livestock feeds, seeds, etc (quantified into kilograms or tons.)
4. Crop yield: It is a measurement of the quantity of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of food production at a certain period.
5. Use of inputs (this assesses the level of use of improved seeds, fertilizers, and pesticides)
6. Agricultural practices (practice of irrigation and soil protected against erosion) and others.

---

<sup>1</sup> Permanent crops are crops produced from plants which last for many seasons, rather than being replanted after each harvest. Those crops are fruit trees, sugar cane, coffee, tea, banana, tree plantations, nuts trees among others).

## II. SURVEY DESIGN

### 2.1. Sample frame design

To provide the basis for conducting probability surveys based on complete coverage of the farm level, and as a better way of collecting agricultural data and find better precise survey estimates, SAS uses a Multiple-Frame Sampling (MFS) methodology by which, area frame is constructed, and survey sample is drawn from it. In addition, a list frame of large-scale farmers (LSF), with at least 10 hectares of agricultural holdings is done to complement the area frame to cover crops mostly grown by large scale farmers which are not easily covered in area frame. To construct area frame, the process involves the following two steps: land cover classification, land stratification and sampling of segment.

#### 2.1.1. Land classification

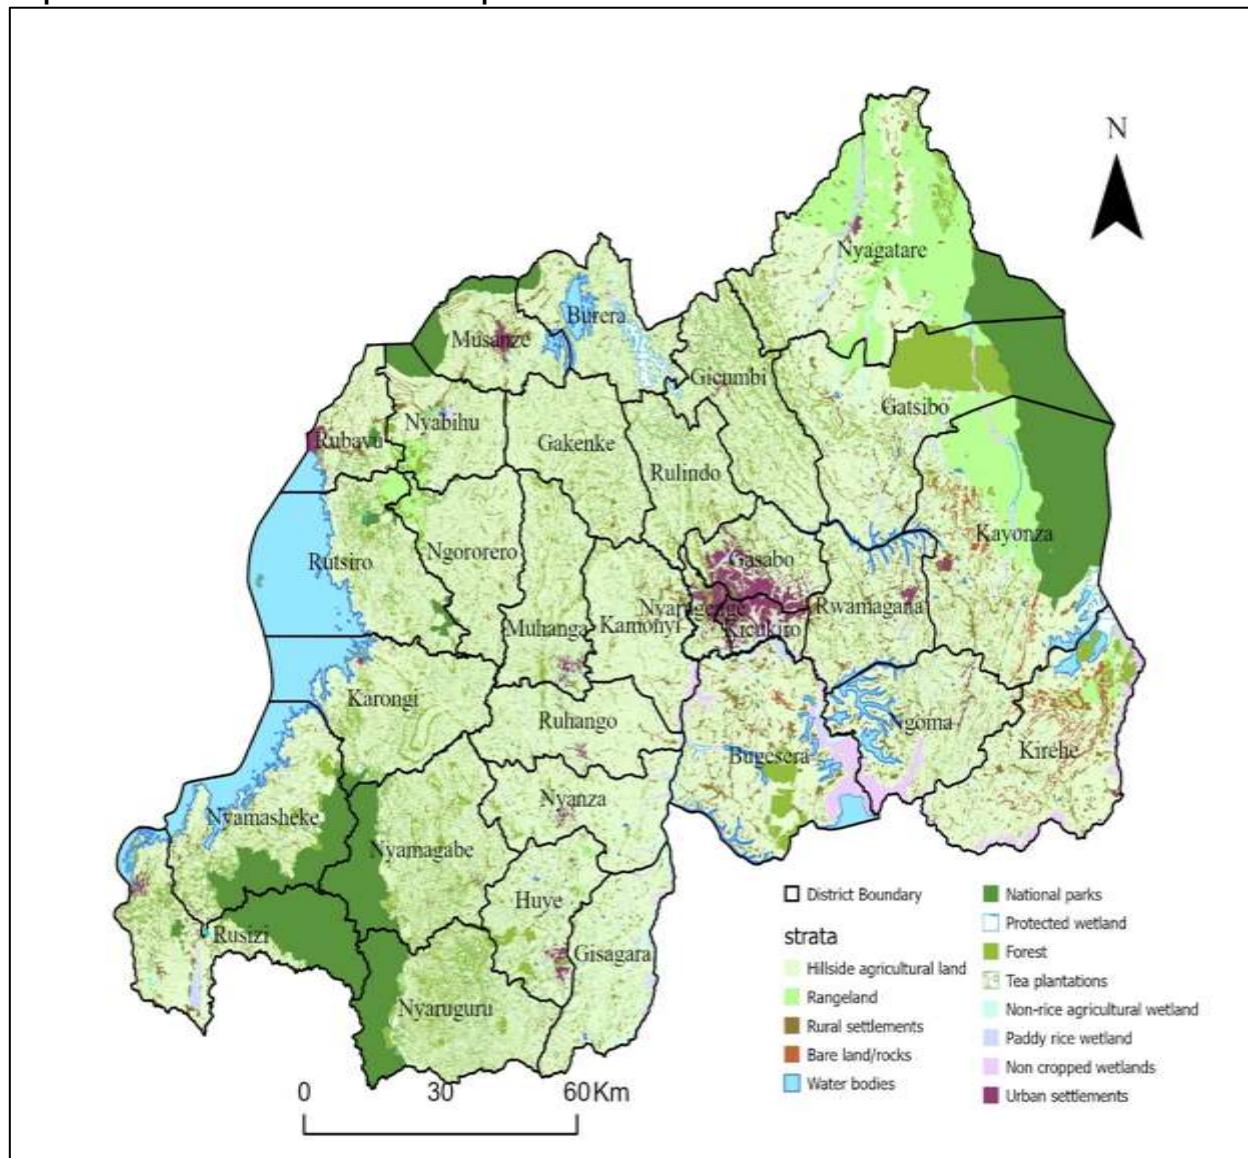

Land classification was done using Rwanda land cover map which is a combination of different layers available in the country, plus a photo interpretation of a series (2010 to 2020) of high-resolution satellite images from Worldview. The Rwanda land cover map is divided into 13 land cover classes (as shown in Table 1).

**Table 1: List of Rwanda land cover classes**

No	Code	Land cover class name	Area (Ha)	Percentage share
1	1.0	Consolidated tea plantations	17,821	0.70
2	1.1	Hillside agricultural land	1,343,933	53.10
3	2.1	Non-rice agricultural wetland	55,807	2.20
4	2.2	Paddy rice wetland	21,848	0.90
5	2.3	Non cropped wetlands	37,743	1.50
6	3.0	Rangeland	144,490	5.70
7	4.1	Urban settlements	31,612	1.20
8	4.2	Rural settlements	78,928	3.10
9	5.0	Bare land/rocks	15,404	0.60
10	6.0	Water bodies	135,295	5.30
11	7.0	National parks	241,455	9.50
12	8.0	Protected wetland	12,201	0.50
13	9.0	Forest plantations	395,001	15.60

Source: NISR, SAS 2023

**Map 1: Rwanda land classification map done in 2020**

Source: NISR, SAS 2023

The second step of building the area sample frame was to group land cover classes into strata in order to identify agricultural strata to be considered in sample frame.

### 2.1.2. Stratification

Out of thirteen land cover classes, five are considered for the agricultural survey frame. These classes are:

- Consolidated Tea plantation,
- Hillside agricultural land,
- Non-rice agricultural land,
- Paddy rice agricultural wetland,
- Rural settlement.

The remaining land cover classes are excluded from the sampling frame due to low potentiality for agriculture activities. The sampling frame is made of a set of square clusters (segments) of 9 hectares each covering the whole country. By overlapping the clusters layer with land cover classes layer, each cluster is assigned a dominant land cover class as a stratum definition. This is based on a defined thresholds as follow:

**Table 2: List of strata**

Stratum	Stratum name	Definition
1.	Dominant hill crop land stratum	Clusters with Hillside agricultural land cover class greater or equal to 60 percent of the total area of the cluster
2.	Dominant Wetland crops stratum	Clusters with non-rice wetland land cover class greater than 25 percent of total area of the cluster
3.	Dominant rangeland	Clusters with rangeland land cover class greater or equal to 60 percent of the total area of the cluster
4.	Mixed stratum	The rest of other possible combinations
9.	Excluded stratum	All clusters with excluded land cover classes greater or equal to 50 percent of the total area of the cluster

Source: NISR, SAS 2023

In addition, tea plantation class data which are recorded by the National Agricultural Export Development Board and large-scale farms which are completely enumerated during the Seasonal Agricultural Survey, were not considered in the agricultural strata taken in sample frame. This means that only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum were considered as area frame from which a sample segment was selected.

**Table 3: Number of segments (Population size) per district by stratum**

Districts	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum	Excluded stratum	Total

Source: NISR, SAS 2023

## 2.2. Sampling procedures

Out of five defined agricultural strata, only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum are considered as land potential for agriculture. The remaining stratum is the non-agricultural land. Note that clusters covered by tea plantations are not considered in the area sample frame due to reasons stated above. Thus, SAS is conducted on 4 above mentioned strata to cover other major crops where a total of 1,200 segments constitutes the SAS sample.

At first stage, 1200 segments are selected and allocated at district level based on the power allocation approach (Bankier, 1988<sup>2</sup>). Sampled segments inside each district are distributed among strata with a proportional-to-area criterion.

**Table 4: Allocation of 1200 sampled segments per district by stratum.**

District	Stratum				Total
	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum	
Nyarugenge	12	6	-	2	20
Gasabo	22	4	-	3	29
Kicukiro	13	5	-	2	20

<sup>2</sup> Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. The American Statistician, Vol. 42, n. 3 pp. 174-177.

At the second stage, 25 sample points are systematically selected, following a special distance of 60 meters between points. Sample points are reporting units within each segment, where enumerators go to every point, locate, and delineate the plots in which the sample point falls and collect records of land use and related information.

The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

**Map 2 : Map showing square cluster(segment) with 25 sampled points**

Source: NISR, SAS 2023

### 2.2.1. Weighting procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

where:

$p_{1h}$  = probability of selection of sample segments in stratum h (district by stratum)

$n_h$  = number of sample segments selected in stratum h

$N_h$  = Total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hij}}{A_{hi} \times g_{hij}}$$

Where:

$p_{2h}$  = Probability of selection of the plot in segment h

$g_{hi}$  = Number of grid squares selected in the i-th sample segment of stratum h

$A_{hij}$  = Area of the j-th sample plot selected in the i-th sample segment of stratum h

$A_{hi}$  = Area of the i-th sample segment of stratum h

$g_{hij}$  = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phi} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

## 2.3. Data collection design

SAS data collection is carried out into two distinct phases: the first phase, known as screening activity (post-planting phase), consists of visiting all sampled segments and demarcating all plots with sampled points with the aim of covering the information related to land area, planted crops and land use. While the second phase involves capturing of production data by visiting sampled agricultural plots identified from screening activity as well as all Large-Scale Farmers (LSF). During this season, NISR employed 134 Enumerators and 26 Team Leaders. All fieldwork staff hold a degree in agriculture sciences and were trained by NISR headquarter staff before starting data collection. To ensure the smooth completion of the SAS workload, a higher-level supervision was organised and done by staff from NISR who visited the field teams during each phase of data collection to ensure the quality of collected data.

### 2.3.1. Time frame

The data collection activities started on 4<sup>th</sup> December 2022 and ended on 16<sup>th</sup> February 2023 covering 1,200 segments and 345 large scale farmers' holdings across the country, while the analysis and reporting were completed by April.

### 2.3.2. Data collection tools and materials

The seasonal agricultural survey uses two main questionnaires:

- **Screening Questionnaire:** Screening questionnaire is a questionnaire used to collect information mainly related to land use, plot area and crop cultivated of the delineated plot.
- **Plot Questionnaire:** Plot questionnaire is a questionnaire used to collect information on the sampled plots mainly related to crop production, inputs used and agricultural practices.

The computer assisted personal interview (CAPI) data collection methodology was used based on three different software applications:

- **Collector:** which is GIS based application, is used to identify and navigate the enumerator team to the exact GPS sample-point location and for mapping the plot boundary for GIS area determination,
- **Survey 123:** which is an electronic instrument, used to collect screening data for Large-scale farmers.
- **CS Entry application,** which is a CSPro data entry application used on Android tablets, was used to collect data for interview of plot questionnaire.

Before proceeding to the field, enumerators and their team leaders ensure that they have required materials for their fieldwork. Each enumerator and team leader had adequate materials composed of enumerator's instruction manual, android tablet, charger, Power banks, pens, notebooks, pencils, calculator, weighing scales, Global Positioning System (GPS), boots, as well as transport facilitation.

### 2.3.3. Field data collection procedures

The SAS data collection is carried out into two phases:

- **Screening activity of the Segment:** Arriving at the segment, field workers use GPS to direct them to the sampled point inside the segment. Arriving at the point, enumerators identify plot boundary with the guide of the farmer and delineate the plot using the collector application with GPS connected to the tablet. For large scale farmers, the team ensures a complete enumeration of plots with at least 10 hectares.
- **Farm Interview:** After screening activity, only sampled agricultural plots are provided to enumerators for collecting information using the plot questionnaire.

## 2.4. Data processing and analysis

CAPI data collection method used allows the enumerators to collect data with the tablets and synchronize to the central server at headquarter where data are received, checked for consistency and transmitted to analysts for further analysis using STATA and Excel.

## 2.5. Concepts, definitions, and estimation methods

**1. Total land area:** Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

**2. Agricultural area:** The agricultural area includes arable land, land under permanent<sup>3</sup> crops and permanent pasture.

**3. Arable land:** As defined by FAO, arable land includes land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

**4. Permanent crop land:** Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, and Tea.

**5. Permanent pastureland:** Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

---

<sup>3</sup> For some plots, permanent crops are mixed with temporary crops which mean that same area is counted in both arable land area and area under permanent crop.

**6. Irrigated agricultural land:** Area equipped for irrigation, which is actually irrigated. Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is actually irrigated refers to physical areas.

**7. Physical area:** Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

**8. Crop area (cultivated area):** Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture. This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot. In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

### Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100% occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80% of the total plot area. In that case the area of maize equals 0.8 hectares (1hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60% and 40% of total plot area respectively. The maize area will be 0.6 hectare (1hectare times 0.6), and beans area will be 0.4(1hectare times 0.4).
- When seasonal and perennial crops are mixed together in same plot, due to the fact that perennial crops are permanent crops in nature, their shares are treated separately from seasonal crops. The seasonal crops share is obtained by the aforementioned rule, while for perennial crops shares are given based on density (spacing between trees) and it may exceed 100 percent. For example, a plot of 1 hectare grown with maize, bean and cassava with 60 %, 40% and 50% shares respectively. Maize area will be 0.6 hectare (1hectare times 0.6), beans area will be 0.4 (1hectare times 0.4), while cassava area will be 0.5 hectare (1hectare times 0.5).

**9. Developed area:** Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area. Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

**10. Harvested area:** Area harvested is defined as the total number of hectares for all crops that is harvested in each agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area.

For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava, if the farmer only harvested 1,250 trees. In this case, the farmer harvested only a quarter (0.125hectares) of the cultivated area.

**11. Crop yield:** Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

**12. Crop production:** Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produce times total harvested area in the district.

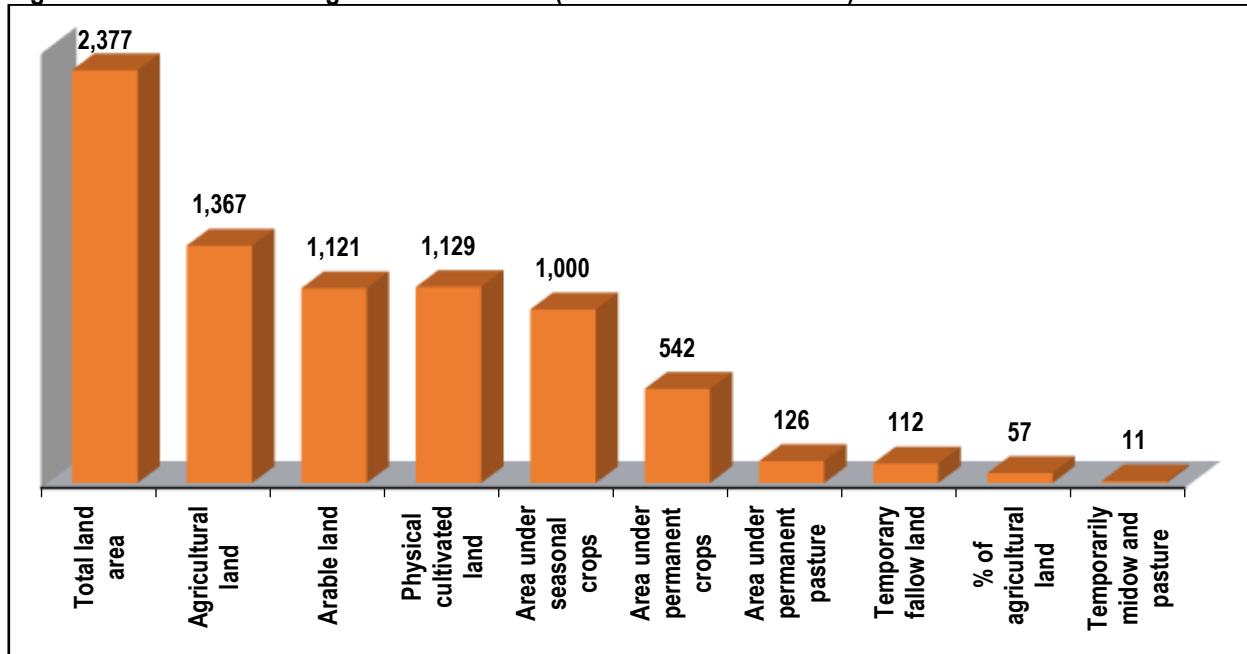

### III. SURVEY FINDINGS

This section highlights key results related to crop area (physical land use, cultivated area, and harvested area), yield, production, agricultural inputs, and agricultural practices in Rwanda in the Season A of 2023.

#### 3.1. Agricultural land use

The total country land area is estimated at 2.377 million of hectares for which 1.367 million hectares (57.5% of total country land) is used for agriculture. In 2023 Season A, 1 million hectares were used for Seasonal crops, 0.5 million hectares were covered by permanent crops, while 0.126 million hectares were used for permanent pasture. (See district details in Table 6).

Figure 1: 2023 Season A - Agricultural land use (in thousands of hectares)

Source: NISR, SAS 2023

#### 3.2. Crop area, production, and yield estimates for major crops

##### Maize:

- The cultivated area for Maize was estimated at 226,982 hectares, an increase of 3.3 percent when compared to the season A of 2022.
- The production of maize was estimated at 390,879 metric tons, an increase of 12 percent when compared to season A of 2022.
- The national average yield of maize 1.7 tons per hectare, with an average yield of 1.7 tons and 4.3 tons for small scale farmers and large-scale farmers respectively (See district details in Tables 5, 8-12)

##### Sweet potato:

- The cultivated area for sweet potato was estimated at 106,670 hectares, an increase of 9.1 percent when compared to season A of 2022 season A.
- The production of sweet potato was estimated at 667,598 metric tons, a decrease of 3.8 percent when compared to season A of 2022.
- The national average yield of sweet potato was 7.4 tons per hectare (See district details in Tables 5, 8-12).

**Irish potato:**

- The cultivated area for Irish potato was estimated at 55,613 hectares, a decrease of 1.5 percent when compared to season A of 2022.
- The production of sweet potato was estimated at 454,355 metric tons, a decrease of 6.5 percent when compared to season A of 2022.
- The average yield of Irish potato was 8.2 tons per hectare, with an average yield of 8.2 and 12.2 tons per hectare for small scale farmers and large-scale farmers respectively (See district details in Tables 5, 8-12).

**Cassava:**

- The cultivated area for cassava was estimated at 239,221 hectares, an increase of 28.5 percent when compared to season A of 2022. In the same season, the harvested area was estimated at 45,182 hectares.
- The production of cassava was at 608,693 metric tons, a decrease of 4.6 percent when compared to season A of 2022.
- The national average yield of cassava was 13.5 tons per hectare (See district details in Tables 5, 8-12).

**Paddy rice:**

- The cultivated area for paddy rice was estimated at 16,135 hectares, an increase of 1.9 percent when compared to season A of 2022.
- The production of paddy rice was estimated at 63,688 metric tons, a decrease of 4.9 percent when compared to season A of 2022.
- The national average yield of paddy rice was 4 tons per hectare, with an average yield of 2.3 and 4 tons per hectare for small scale farmers and large-scale farmers respectively (See district details in Tables 5, 8-12).

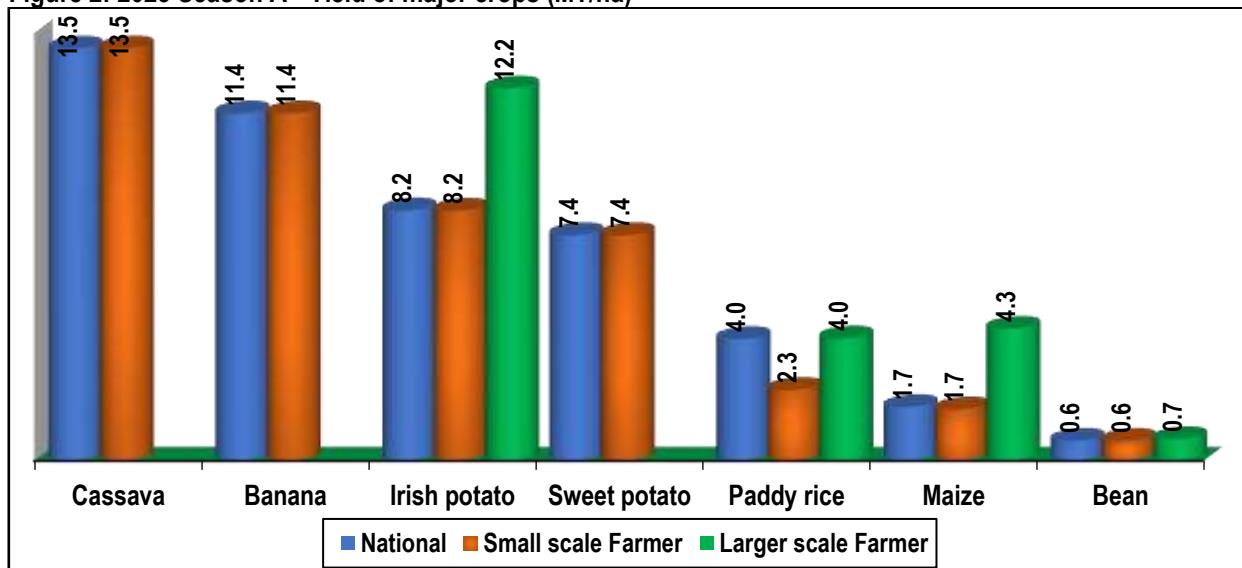

**Banana:**

- The cultivated area for Banana was estimated at 255,290 hectares, a decrease of 1.6 percent when compared to season A of 2022. In the same season, the harvested area was estimated at 107,411 hectares.
- The production of banana was estimated at 1,219,408 metric tons, an increase of 2.3 percent when compared to 2022 season A.
- The average yield of banana was 11.4 tons per hectare (See district details in Tables 5, 8-12).

**Beans:**

- The cultivated area bean was estimated at 312,279 hectares, decrease of 13.8 percent when compared to season A of 2022.
- Bean's production was estimated at 197,212 metric tons, a decrease of 16.4 percent when compared to season A of 2022.
- The national average yield of beans was 632 kilograms per hectare, with an average yield of 632 and 685 kilograms for small scale farmers and large-scale farmers respectively (See district details in Tables 5, 8-12).

### 3.3. Use of inputs

This section highlights the use of agricultural inputs (seeds, fertilizers, and pesticides). they are presented in terms of percentage of farmers who applied agricultural inputs throughout the season.

Figure 3: 2023 Season A\_Use of inputs by farmers (in percentage)

Source: NISR, SAS 2023

#### 3.3.1. Use of seeds

In season A of 2023, 37.1 percent of farmers used improved seeds. In regard to farmer type<sup>4</sup>, 35.9 percent of small-scale farmers (SSF) and 85.7 percent of Large-scale farmers (LSF) used improved seeds (See Figure 3). The major sources of improved seed were agro-dealers, accounting 40.8 percent, and NGO/companies accounting for 38.7 percent (See details in Tables, 17-20).

#### 3.3.2. Use of fertilizers

In season A of 2023, 87.9 percent of farmers applied organic fertilizer with 88.2 percent of small-scale farmers and 74.2 percent of large-scale farmers applied organic fertilizer.

In this season, 59.6 percent of farmers applied inorganic fertilizer with 59 percent of small-scale farmers and 87.9 percent of large-scale farmers applied inorganic fertilizer (See figure 3). The main sources of inorganic fertilizers were NGOs/companies and agro dealers account for 44.8 percent and 41.8 percent respectively. DAP, UREA and NPK are inorganic fertilizers mostly used in this season with 45.2 percent, 39.9 percent and 12.7 percent respectively (See details in Tables 7,21-25).

#### 3.3.3. Use of pesticides

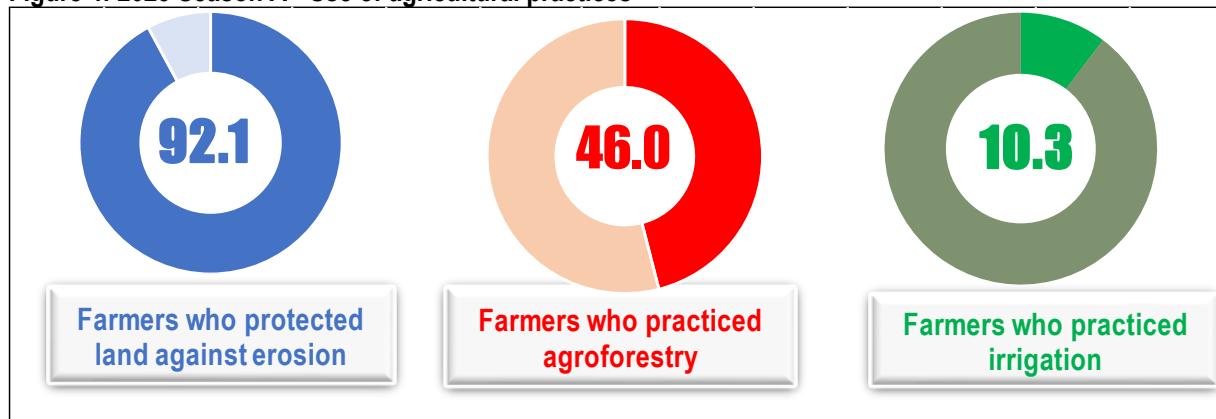

In season A of 2023, 34.5 percent of farmers applied pesticides. According to farmer type, 33.2 percent of small-scale farmers and 86.3 percent of large-scale farmers applied pesticides respectively (See figure 3). Rocket, Dithane and Cypermethrin were the most used pesticides with 38.9 percent of farmers, 22.2 percent and 15.2 percent respectively (See details in Tables 26 & 27).

<sup>4</sup> Farmer type refers to category of farmers as defined in the survey; a farmer is either a small scale or a large scale.

### 3.4. Agricultural practices

This section highlights information related to agricultural practices used by farmers related to irrigation, anti-erosion activities and agroforestry. The results are presented in terms of percentage of farmers involved in such practices throughout the 2023 Season A.

Figure 4: 2023 Season A - Use of agricultural practices

Source: NISR, SAS 2023

#### 3.4.1. Irrigation practices

In season A of 2023, 10.3 percent of farmers practiced irrigation. The irrigation was practiced by 9 percent of small-scale farmers and 66.5 percent for large-scale farmers. Out of farmers who practiced irrigation 53.6 percent practiced the modern irrigation. In regard to source of water, Lakes/stream and underground water were the most used sources of water for irrigation with 49.9 percent and 27.8 percent respectively (See details in Tables 7,28-30).

#### 3.4.2. Erosion control measures

In 2023 Season A, 91.2 percent of farmers practiced anti-erosion activities where 92.1 percent of small-scale farmers and 94.1 percent were large-scale farmers protected their land against erosion. Cover plants was the most used type of anti-erosion with 56.7 percent of farmers. The farmland was less eroded where the major erosion type was low degree of erosion (splash erosion and wind erosion) appeared the most with 80.6 percent (See details in Tables 7, 28, 31 and 32). 46 percent of farmers practiced agroforestry, while 1.2 percent of farmers used mechanical equipment in their agricultural activities.

## IV. MAIN TABLES

# NISR STAFF WHO CONTRIBUTED TO SEASONAL AGRICULTURE SURVEY

## 2023 Season A

### National Coordinators

- MURANGWA Yusuf, Director General, NISR
- MURENZI Ivan, Deputy Director General, NISR

### Technical coordination

- MWIZERWA Jean Claude, Director of Economic Statistics Department
- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BIZIMUNGU Clément, Field operations Cartographer Officer

### Sample frame design

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BURAMBA Eric, Seasonal Crop Production Statistician

### Field work coordination

- KAMANZI SHINGIRO Jean Philbert, Research assistant
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician

### Data analysis

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- MUVUNYI Issa, Livestock and fisheries production statistician
- MUTEBUTSI Alexis, Research assistant
- MUREBWAYIRE Divine, Research assistant
- RWAYITARE Jean Bosco, Research assistant

### GIS

- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- MUNDERERE Theophile, Spatial Databases Geometrician Officer
- NTAWIHA Athanasie, SPIU GIS staff
- IRAMBONA Eddy Marcus, SPIU GIS staff
- NIYITEGEKA Beata, GIS Support Staff
- NDAZIGARUYE Alfred, GIS Support Staff
- NGABO MUHIRE Olympe, GIS Support Staff

### Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- RWAYITARE Jean Bosco, Research assistant

### Report writing and editing.

- RWAYITARE Jean Bosco, Research assistant
- MUTEBUTSI Alexis, Research assistant
